

1. Correctness (Examples 1 & 2)	Algorithm 1A/0 reproduce $w^\dagger = (5.5, 5.5)$, $r^\dagger = 4.5$ on Example 1; 55 unit tests PASS.	PASS
2. Completeness (public API)	All 51 public symbols of <code>\texttt{lcp}</code> importable + callable.	PASS
3. Performance (LP solve time vs L)	Algorithm 1A LP wall-time ≤ 1 ms at $L \in \{2, 3, 5, 8, 12\}$.	PASS
4. Effectiveness (Theorem 4.1 inside Ω)	0/200 random weights in $\Omega(p^*) \cap [1, 10]^2$ recover lex.	PASS
5. Utility (calibrated vs naive weights)	1/5 weight strategies recover lex; only interior Ω weights succeed.	PASS
6. Perturbation stability (Theorem 7.1)	11/181 in- Ω perturbations preserve $b = (1, 1)$; 0/19 outside- Ω do.	PASS
7. Procedure 10.1 convergence	Procedure 10.1 converges in 2 iterations to $(\delta_1, \delta_2, \delta_3) = (0, 0.5, 0.4)$.	PASS
